

When Benchmarks Lie: Temporal Data Leakage Reverses TSAD Rankings

The Problem: Temporal Data Leakage

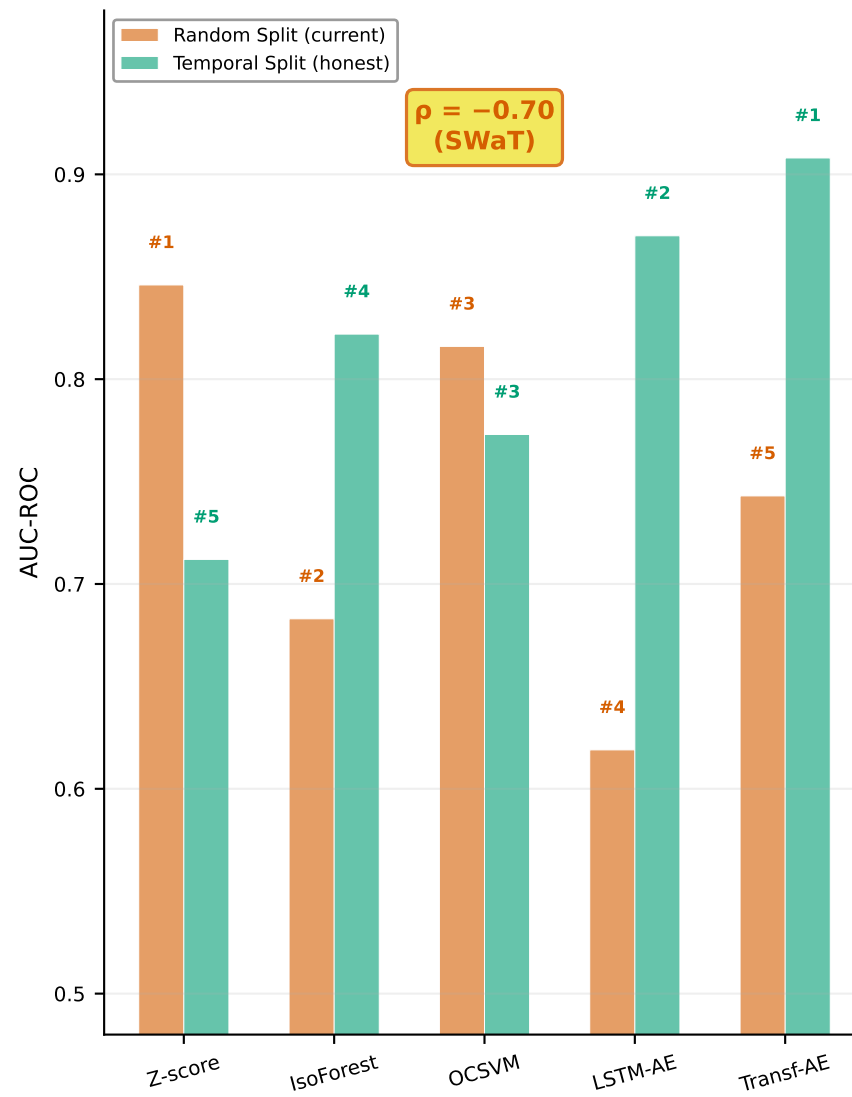

Raw Time Series (T time steps, D sensors)

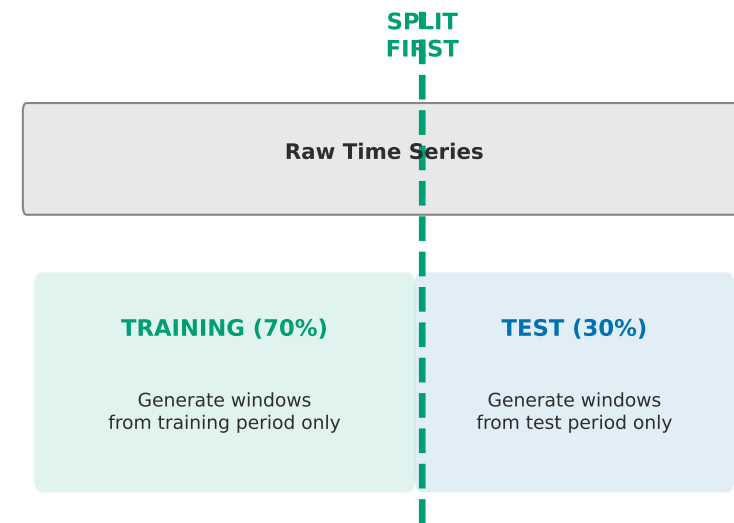

Random split mixes overlapping windows into train & test

→ Model trains on test data

The Finding: Rankings Reversed

The Fix: Temporal-Split Protocol (TSP)

TSP: One line, zero new infrastructure – just reorder your preprocessing

```
split_idx = int(len(ts) * 0.7)  
ts_train, ts_test = ts[:split_idx], ts[split_idx:]
```
